HEALTH REPORT

Exercise-Induced Collapse (DNM1)

What does this result mean?

This result should not impact Teeka's health but it could have consequences for siblings or other related dogs if they inherited two copies of the variant. We recommend discussing this result with their owners or breeders if you are in contact.

Impact on Breeding

Your dog carries this variant and will pass it on to ~50% of her offspring.

What is Exercise-Induced Collapse?

EIC has been linked to a mutation in the DNM1 gene, which codes for the protein dynamin. In the neuron, dynamin trucks neurotransmitter-filled vesicles from the cell body, where they are generated, to the dendrites. It is hypothesized in dogs affected with EIC, the mutation in DNM1 disrupts efficient neurotransmitter release, leading to a cessation in signalling and EIC.

When signs & symptoms develop in affected dogs

Signs develop in juvenile dogs, typically before 3 years of age.

How vets diagnose this condition

Genetic testing, clinical signs, and muscle biopsy can be used to diagnose this disorder.

How this condition is treated

Dogs with this condition are otherwise normal and healthy, though some severely affected dogs have died during an episode. The factors determining the severity of an episode on a given day or in a given dog is unknown.

Actions to take if your dog is affected

Minimizing or eliminating intense exercise is the best way we currently know to prevent complications from this condition.
